The JVM can be explained as an engine that uses the Java Development Kit to provide an execution environment³ run the java code³ or its applications. When an applet starts, the init(), start(), and paint() methods are called in a sequence and when an applet is terminated, calls to the stop() and destroy() methods take place. JFreeChart is a Java gráficos library that helps developers show good quality gráficos in the applications they develop. To enter the MVC that is known as the model view driver, it makes use of the Java servlet API and also extends its functions to get more results. It is usually embedded in an HTML page using the APPLET or OBJECT tag and is treated on a web server. Applets are used to make the website more productive and entertaining. The spring CVM has a number of advantages, such as rapid development and ease of testing. Design patterns can be explained as a general repeatable solution³ a problem that occurs commonly in large quantities during software design. This is the class with which objects are created. Targets client-side and server-side applications. JavaFX and Swing components, vector graphics file formats such as SVG, PDF, image files such as JPEG and PNG are some of the output types that it supports. The daemon thread is a low-need string (in the JVM setting) that runs on the foundation³ to make allocations, for example, the garbage assortment (GC) and so on, do not keep the JVM from exiting (regardless of whether the daemon string itself is running) when all client strings (non-daemon strings) end its execution³ n. Memory leaks are banned with the help of automatic garbage collection³ java. Interpreted: At the³ java is in bytecodes by the java compiler that is then interpreted and executed by the Java interpreter or a just-in-time compiler (JIT). The class makes data and methods in a single unit. The programming is done by relating a problem with the real world object. Track: At the conversion of the Java program in Java bytecodes takes place. Design patterns are not considered a finished design and can not be converted directly into code. It is a very reliable and effective framework. HASHING refers to the way you use some function or algorithm to assign objects data to some representative whole value. It also depends to a large extent on the language used. An applet is a Java application that can be installed on a web page and runs on the web browser and works on the client side. Types of standardization: 1NF: 1NF rules are that each table must contain an unique value and that the records must be unique. 2nf: 2NF rules are that the table must be at 1NF and must have a single key column. 3NF: 3NF rules are that the table must be in 2 NF and should not have any transitive functional dependence. BCFN: The normal Boyce Codd form rules is that it must be in 3 NF and should not have more A key candidate. Difference between class and object in Java: Class è "a class is like a project.
